

FORMABLE BRIGHT FILM HAVING DISCONTINUOUS METALLIC LAYERS

ABSTRACT OF THE DISCLOSURE

The invention is a formable, bright metallized laminate that has superior optical and deformation properties. The 5 metallized laminate is made from a plurality of discontinuous metal island layers deposited on a formable clear coat film. The invention is also a method that includes depositing a first discontinuous layer of metal islands upon a formable clear coat film and then depositing a second discontinuous 10 layer of metal islands onto the first discontinuous layer of metal islands.
